

offered important insights into the possible underlying biological mechanisms by which low-level indoor ozone may affect cardiovascular health in children, and indicated that more protective measures should be taken to alleviate the acute adverse effects of indoor ozone in this susceptible population.

Funding sources

This work was supported by the National Key Research and Development Program of China [grant number 2017YFC0702700, 2016YFC0206506]; the National Natural Science Foundation of China [grant numbers No. 91543112, 81571130090, 81502780, 81502780]; and China Medical Board [grant number CMB 15-228]; the British Heart Foundation Special Project Grant (grant number SP/15/8/31575); and the UK Natural Environment Research Council (grant number NE/N007182/1).

Declaration of Competing Interest

All authors declare they have no actual or potential conflict of interests.

Acknowledgements

We thank the children and the school teachers for their cooperation in the program.

Appendix A. Supplementary data

Supplementary data to this article can be found online at <https://doi.org/10.1016/j.envint.2019.105021>.
