

**Ask yourself: who represents ionization in medicine? Or, what are the scientific results about negative ions?**

Well, we have given the task to an artificial intelligence: Describe me the future with ionization!

See what it answered us:

**Future  
ionization  
in medicine**

*Intelligence protects nature*

## Advantage Ionized Air

The future with ionization looks very promising. It is believed that the use of ions to treat and prevent many diseases will increase. By using negative ions, the body can better absorb oxygen, improving blood flow. It is also expected that electrolysis technology will be used to treat diseases such as diabetes and heart disease.

*„Imagination is the  
preview of the  
coming attractions  
of life.“*

*Albert Einstein*

## Revive nature

### In medicine:

Ionization by electrolysis is used in medicine. This technique is used to regulate the concentration of ions in the body by injecting positive and negative ions into the blood or other body fluids.

### Medical scientist / inside

There is a lot of scientific evidence about negative ions affecting health. Negative ions are usually considered good for health because they help cleanse the atmosphere, increase oxygen levels and reduce the inflammatory process. They are also considered helpful for treating allergies, stress and fatigue.

### What your intelligence tells you?

Well, decide for yourself, decide whether the path of nature can be so wrong.
